

Features

- 0.8V Low Start-Up Input Voltage
- Up to 90%Efficiency
- Adjustable 100mA Output with 1 Alkaline Cell or 200mA Output with 2 Alkaline Cell Battery input.
- 1.8V/3.0V/3.3V/300mA Output with USB Power input.
- Small Number of External Components needed
- Load Disconnects from Input in Shutdown
- Power good output
- 32 μ A Quiescent(Switch OFF) Supply current
- 1 μ A Shutdown Mode Supply current
- 8-Pin TSSOP package

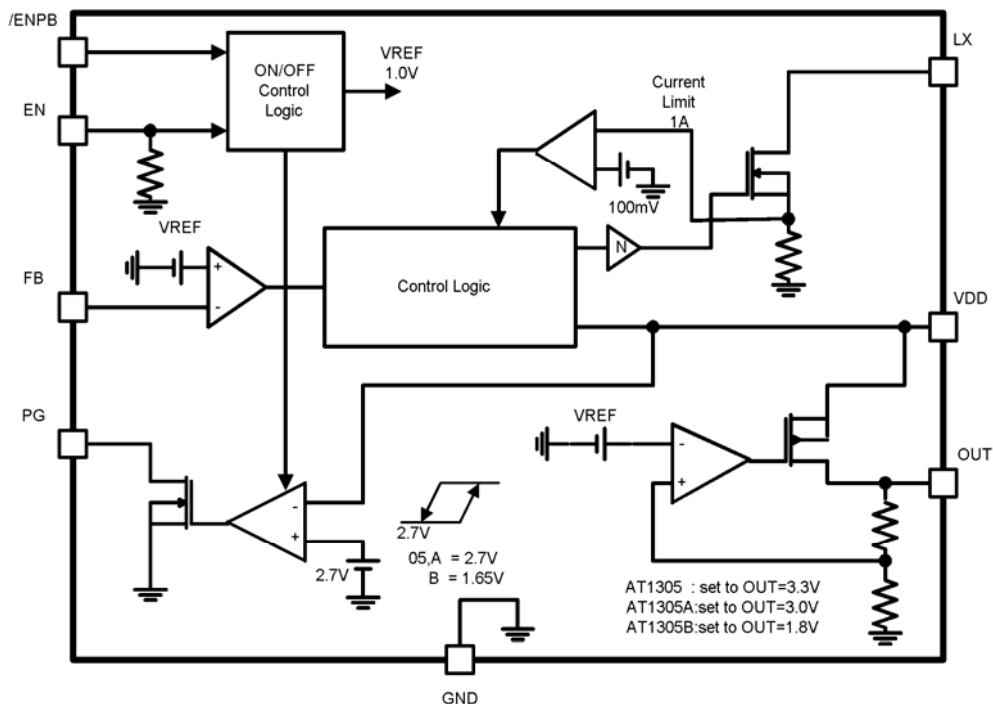

General Description

The AT1305 is a PFM step-up DC/DC converter with LDO for applications using 1 Cell or 2 Cell Alkaline battery and USB applications. Besides, the 32 μ A low quiescent current together with high efficiency maintains long battery life time. It provides a constant output voltage for inputs that vary above and below the output voltage.

Applications

- MP3
- Power source for battery-powered equipment
- Power source for cameras, camcorders, VCRs, PDAs, electronic data banks, and hand-held Communication equipment

1. Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Electrical Characteristics

 (V_{IN}=1.0V, V_{OUT}=2.8V, I_{OUT}=0mA, T_a=+25°C)

Efficiency (Load at LDO output)

Function Description

Boost Converter

The AT1305 integrates a step-up, switch-mode DC/DC converter with a linear regulator to provide step up/down voltage conversion. A pulse frequency modulation (PFM) with a constant on time 4.5us and minimum off-time 1.4μs controls the N-channel MOSFET. The linear regulator contains a P-channel MOSFET. In 1-cell or 2-cell battery input (When VBAT < VOUT), only the step-up regulator is active, and the linear regulator behaves as a pass gate. The output voltage can be adjusted with two external resistors. The formula show as follow equation.

$$VDD = V_{FB} \left(1 + \frac{R1}{R2} \right)$$

$$= 1.2 \times \left(1 + \frac{R1}{R2} \right)$$

The maximum efficiency could be 89% over 50mA load range. The AT1305 guarantee starts up as low as 1.0V input.

LDO mode

The low-dropout linear regulator consists of a reference, an error amplifier and a P-channel MOSFET. In USB mode, when VIN > 4V, the linear regulator is active automatically whether the EN and /ENPB is enabled or not. The output voltage is default 3.3V, 3.0V and 1.8V version. Its driving capability is nearly 250mA.

Power good

The PG pin stays high impedance when the dc/dc converter or the LDO output voltage high than 2.7 V, and falling down when the voltage low than 2.6V. It could be used to enable the processor after the push-button start-up.

On/Off Control

A single pushbutton switch can be used to turn the AT1305 on and off. EN is pulled low (internal) and /ENPB is pulled high when the AT1305 is off. When the switch is pressed, /ENPB is pulled low and the IC turns on. The switch should be on long enough for the processor to exit reset. The controller issues a logic high to EN, which guarantees the IC will stay on regardless of the switch state.

EN	/ENPB	AT1305
0	0	ON
0	1	OFF
1	0	ON
1	1	ON
